INTERFACE MODULE FOR BONEMIC

This voiceducer module directly connects to your GP344/388 radio and offers the latest in bone vibration technology. Voiceducers use bone induction technology to pick up speech via vibrations in the ear canal created when the user speaks. This means the radio message can be clearly heard in noisy environments without having to raise their voice above a normal speaking level. The microphone and earpiece are housed in the same small 'in-ear' earpiece that negates the need for a boom microphone. This module includes a Vox/PTT selector allowing the user to operate in either voice activation mode (Vox) or push-to-talk mode.
